Creating a Page and Adding Information

Adding a Page

To add a page, select **Pages-** 

-from the course navigation menu on the left.

If your course does not already have a Front Page selected, you can add a new page directly from there. If a Front Page is already selected, choose **View All Pages** 

at the top of the screen to access the full list of pages and create a new one.

When to Use Pages

Canvas Pages give you more flexibility to organize and present information than a basic list of files. You can use them to add visual design, incorporate color, organize content, and share information directly within your course rather than simply linking to documents.

Pages can make a course feel more polished and engaging, but there is a trade-off: creating visually appealing pages that also meet accessibility standards takes time. The initial setup can be a bit of a time sink, especially if you are building pages from scratch.

Pages can transfer successfully when importing course content, provided they are set up and linked correctly. However, there is nothing wrong with keeping things simple. The standard **Modules** layout is often an effective and perfectly reasonable way to organize course materials.

Editing a Page

When you select **Edit** on a page, Canvas opens the Rich Content Editor. This is where you add and format text, insert documents, create links, and build the page's content.

The toolbar across the top contains the most commonly used tools, along with an option to view additional tools. If you hover over an icon, Canvas displays its name and function.

Two particularly useful tools are:

Use this option to upload a new document or select a document that has already been uploaded to your course's **Files** area.

One approach I like is to type the document's name into the page, highlight the text, and then insert the document link. This creates a descriptive, clickable link rather than displaying a generic file name or URL. However, this is a matter of preference; it is not required.

Link

Use the Link tool to add a link to an external website or another location within Canvas.

A helpful tip: If you plan to import this course into future courses, use links that point to content within the course rather than links that point to a specific course URL. This makes it easier for Canvas to maintain the connections when course content is copied or imported.
